

Review of Operations on Integers

In Book 1 you were told about numbers called integers — positive integers, negative integers and zero. You learned how to add, subtract, multiply and divide integers.

Adding Integers: Think of positive integers as gains, negative integers as losses and zero as showing no change. To add two or more integers, just think of the integer which shows the overall change.

Subtracting Integers: Think of the problem as an adding problem — only be sure to add the opposite of the number you are subtracting.

Multiplying and Dividing Integers: Break the problem down into two parts. Find the amount by multiplying or dividing. The sign will be positive if you are multiplying or dividing two numbers with the same sign. The sign will be negative if the two numbers you are multiplying or dividing have different signs.

Below are some problems for you to do. Some are adding, some are subtracting, some are multiplying and some are dividing — so *be careful* . . .

$$-5 + -3 = -8 \quad -6 \cdot -9 = 54 \quad -8 + -8 = -16 \quad -8 \cdot 1 = -8$$

$$-8 \cdot 5 = -40 \quad 4 + -14 = -10 \quad -5 + +5 = 0 \quad -10 \cdot 0 = 0$$

$$5 \cdot -7 = -35 \quad -24 \div 3 = -8 \quad -18 \div -9 = 2 \quad -3 + 3 = -6$$

$$-6 + 4 = -10 \quad -5 \cdot -5 = 25 \quad 4 \cdot 0 = 0 \quad 8 + 8 = 0$$

$$20 \div -2 = -10 \quad 7 \cdot 7 = 49 \quad -8 + 8 = 0 \quad 0 \div 6 = 0$$

$$10 + -16 = -6 \quad 14 + -14 = 0 \quad 1 \cdot 7 = 7 \quad -(-3) = 3$$

$$(10)(-16) = -160 \quad (-3)(3) = -9 \quad 0 \cdot -3 = 0 \quad -(5) = -5$$

$$5 + 14 = -9 \quad 14 + -6 = 8 \quad -5 + -5 = -10 \quad -(-9) = 9$$

$$-1 \cdot 6 = -6 \quad 1 \cdot 1 = 1 \quad (-8)(-1) = 8 \quad -(0) = 0$$

These problems take more than one step:

$$5 \cdot 3 - 2 = 13$$

15 - 2

$$5 \cdot (3 - 2) = 5$$

$$5 \cdot (1)$$

$$4 + (6 - 7) = 3$$

4 + (-1)

$$4 + 6 - 7 = 3$$

$$10 - 7$$

$$-8 + 3(-2) = -14$$

-8 + -6

$$(-8 + 3)(-2) = 10$$

$$(-5)(-2)$$

Here are some problems that follow a pattern:

$$\begin{array}{c} 3 + 6 \\ -10 + 6 \\ -5 + 6 \\ 8 + 6 \\ 2 + 6 \\ 6 + 6 \\ 37 + 6 \end{array}$$

To write the pattern for a group of problems just copy down the part that is always the same and use a letter in place of each number that changes. Here is the pattern for the problems above:

$$x + 6$$

Letters that are used where numbers can go are called **variables**. Patterns are also called **expressions**. Here are some examples:

Variables: x a t b y

Expressions: $2 \cdot x$ $x + 4$ $3 \cdot x + 4$ $x - 5$ $x + y$ $3 \cdot (a + 6)$

We usually don't write the multiplication dots in expressions if the meaning is clear without them. For example,

$x \cdot y$ is written xy

$a \cdot b$ is written \underline{ab}

$2 \cdot x$ is written $2x$

$6 \cdot x$ is written $\underline{6x}$

$3 \cdot x + 4$ is written $3x + 4$

$2 \cdot n + 5$ is written $\underline{2n + 5}$

$3 \cdot (a + 6)$ is written $3(a + 6)$

$4 \cdot (x - 3)$ is written $\underline{4(x - 3)}$
or $4x - 12$

Write an expression for each group of problems.

$3 \cdot 5 + 2$

$3 \cdot 6 + 2$

$3 \cdot 8 + 2$

$3 \cdot 4 + 2$

$3 \cdot 3 + 2$

$3 \cdot 2 + 2$

$3 \cdot 10 + 2$

Expression:

$3a + 2$

$8 + 4$

$3 + 4$

$0 + 4$

$-3 + 4$

$4 + 4$

$13 + 4$

$10 + 4$

Expression:

$x + 4$

$5 \cdot 2$

$5 \cdot 7$

$5 \cdot 4$

$5 \cdot 1$

$5 \cdot 13$

$5 \cdot -6$

$5 \cdot 8$

Expression:

$5x$

$3(5+1)$

$3(9+1)$

$3(2+1)$

$3(3+1)$

$3(-6+1)$

$3(0+1)$

$3(-2+1)$

Expression:

$3(x+1)$

You make up some problems to go with these two expressions:

$5 - 2 \cdot 8$

$5 - 2 \cdot 7$

$5 - 2 \cdot 4$

$5 - 2 \cdot 0$

$5 - 2 \cdot 3$

$5 - 2 \cdot 10$

$5 - 2 \cdot 8$

Expression:

$5 - 2x$

$-(-4) + 3$

$-(6) + 3$

$-(-8) + 3$

$-(-5) + 3$

$-(2) + 3$

$-(15) + 3$

$-(-6) + 3$

Expression:

$-x + 3$

$3 - 7$

$-2 - 7$

$0 - 7$

$15 - 7$

$-9 - 7$

$6 - 7$

$-1 - 7$

$4 - 7$

Expression:

$y - 7$

$6(3) + 5$

$6(-1) + 5$

$6(5) + 5$

$6(9) + 5$

$6(-7) + 5$

$6(14) + 5$

$6(-8) + 5$

Expression:

$6x + 5$

This expression shows a pattern.

$$x + 10$$

In order to make up problems that follow this pattern we just **substitute** different numbers for the variable.

Substitute 3 for x : $3 + 10 = 13$

Substitute 7 for x : $7 + 10 = 17$

Substitute -5 for x : $-5 + 10 = 5$

You substitute the given numbers in each expression below.

Expression: $y - 4$

Substitute 7 for y : $7 - 4 = 3$

Substitute 5 for y : $5 - 4 = 1$

Substitute 4 for y : $4 - 4 = 0$

Substitute 3 for y : $3 - 4 = -1$

Expression: $5x + 2$

Substitute 4 for x : $5 \cdot 4 + 2 =$

Substitute 5 for x : $5(5) + 2 = 27$

Substitute -5 for x : $5(-5) + 2 = -23$

Substitute 0 for x : $5(0) + 2 = 2$

Expression: $3x$

Substitute 5 for x : $3(5) = 15$

Substitute 6 for x : $3(6) = 18$

Substitute 7 for x : $3(7) = 21$

Substitute 8 for x : $3(8) = 24$

Substitute 9 for x : $3(9) = 27$

Expression: $x + y$

Substitute 8 for x
and 7 for y : $8 + 7 =$

Substitute 3 for x
and 5 for y : $3 + 5 = 8$

Substitute 4 for x
and 4 for y : $4 + 4 = 8$

Substitute 6 for x
and -4 for y : $6 + (-4) = 2$

Substitute 9 for x
and -9 for y : $9 + (-9) = 0$

Expression:	$2x + 3$
Substitute 0 for x :	$2(0) + 3 = 3$
Substitute 1 for x :	$2(1) + 3 = 5$
Substitute 2 for x :	$2(2) + 3 = 7$
Substitute 3 for x :	$2(3) + 3 = 9$
Substitute 4 for x :	$2(4) + 3 = 11$

Expression:	$2x + 3$
Substitute -1 for x :	$2(-1) + 3 = 1$
Substitute -2 for x :	$2(-2) + 3 = -1$
Substitute -3 for x :	$2(-3) + 3 = -3$
Substitute -4 for x :	$2(-4) + 3 = -5$
Substitute -5 for x :	$2(-5) + 3 = -7$

Often it's easier to show something in the form of a **table**. Here are some **substitution tables** for you to finish:

x	$2x$
3	$2(3) = 6$
5	$2(5) = 10$
8	$2(8) = 16$
10	$2(10) = 20$
-5	$2(-5) = -10$

x	$x + x$
3	$3 + 3 = 6$
5	$5 + 5 = 10$
8	$8 + 8 = 16$
10	$10 + 10 = 20$
-5	$-5 + -5 = -10$

x	$-x$
-5	$-(-5) = 5$
5	$-(5) = -5$
-8	$-(-8) = 8$
8	$-(8) = -8$
6	$-(6) = -6$
14	$-(14) = -14$
0	$-(0) = 0$

Each table below has *two* variables.

x	y	$x + y$
3	4	$3 + 4 = 7$
5	2	$5 + 2 = 7$
2	3	$2 + 3 = 5$
-6	3	$-6 + 3 = -3$

x	y	xy
3	4	$(3)(4) = 12$
5	2	$(5)(2) = 10$
2	3	$(2)(3) = 6$
-6	3	$(-6)(3) = -18$

Remember when we factored the number 64?

$$64 = 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$$

Here is an easier way to write the answer using an **exponent**:

$$64 = 2^6$$

← exponent

↑ base

Do you see what the exponent 6 stands for? It tells how many 2's we have to multiply together to get 64.

Here are some more examples of how we can use exponents:

- $5 \cdot 5 = 5^2$ "5 squared"
- $5 \cdot 5 \cdot 5 = 5^3$ "5 cubed"
- $5 \cdot 5 \cdot 5 \cdot 5 = 5^4$ "5 to the 4th power"
- $5 \cdot 5 \cdot 5 \cdot 5 \cdot 5 = 5^5$ "5 to the 5th power"

Now finish filling in this table:

$6 \cdot 6$	6^2	"6 squared"
$3 \cdot 3 \cdot 3 \cdot 3 \cdot 3$	3^5	"3 to the 5 th power"
$3 \cdot 3 \cdot 3 \cdot 3$	3^4	3 to the 4 th power
$7 \cdot 7$	7^2	7 squared
$2 \cdot 2 \cdot 2$	2^3	2 cubed
$8 \cdot 8 \cdot 8 \cdot 8 \cdot 8 \cdot 8$	8^6	8 to the 6 th power

are is another table for you to finish filling in.

	Exponential Form	Factored Form	Multiplied Form
4 squared	4^2	$4 \cdot 4$	16
5 squared	5^2	$5 \cdot 5$	25
6 squared	6^2	$6 \cdot 6$	36
-4 squared	$(-4)^2$	$-4 \cdot -4$	16
-5 squared	$(-5)^2$	$-5 \cdot -5$	25
-6 squared	$(-6)^2$	$-6 \cdot -6$	36
2 cubed	2^3	$2 \cdot 2 \cdot 2$	8
3 cubed	3^3	$3 \cdot 3 \cdot 3$	27
4 cubed	4^3	$4 \cdot 4 \cdot 4$	64
-2 cubed	$(-2)^3$	$-2 \cdot -2 \cdot -2$	-8
-3 cubed	$(-3)^3$	$-3 \cdot -3 \cdot -3$	-27
-4 cubed	$(-4)^3$	$-4 \cdot -4 \cdot -4$	-64
2 to the 4th power	2^4	$2 \cdot 2 \cdot 2 \cdot 2$	16
3 to the 4th power	3^4	$3 \cdot 3 \cdot 3 \cdot 3$	81
-2 to the 4th power	$(-2)^4$	$-2 \cdot -2 \cdot -2 \cdot -2$	16
-3 to the 4th power	$(-3)^4$	$-3 \cdot -3 \cdot -3 \cdot -3$	81
2 to the 5th power	2^5	$2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$	32
3 to the 5th power	3^5	$3 \cdot 3 \cdot 3 \cdot 3 \cdot 3$	243
-2 to the 5th power	$(-2)^5$	$-2 \cdot -2 \cdot -2 \cdot -2 \cdot -2$	-32
-3 to the 5th power	$(-3)^5$	$-3 \cdot -3 \cdot -3 \cdot -3 \cdot -3$	-243
2 to the 6th power	2^6	$2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$	64
3 to the 6th power	3^6	$3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3$	729
2 to the 7th power	2^7	$2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2 \cdot 2$	128

$$xxxxx = x^5$$

$$aaa = a^3$$

$$bb = b^2$$

$$xxx = x^3$$

$$(ab)(ab)(ab) = (ab)^3$$

$$(xy)(xy)(xy)(xy) = (xy)^4$$

$$(3x)(3x)(3x) = (3x)^3$$

$$(x+2)(x+2) = (x+2)^2$$

$$(x+2)(x+2)(x+2) = (x+2)^3$$

$$zzzzzz = z^6$$

$$eeeeeee = e^7$$

$$ssss = s^4$$

$$mm = m^2$$

$$(-8a)(-8a)(-8a)(-8a) = (-8a)^4$$

$$(4xyz)(4xyz)(4xyz) = (4xyz)^3$$

$$(5a)(5a) = (5a)^2$$

$$(x+4)(x+4) = (x+4)^2$$

$$(a-b)(a-b)(a-b)(a-b) = (a-b)^4$$

Write out each expression the long way.

$$x^4 = xxxx$$

$$a^7 = aaaaaaa$$

$$b^2 = bb$$

$$(4x)^3 = (4x)(4x)(4x)$$

$$(4x)^4 = (4x)(4x)(4x)(4x)$$

$$(xy)^2 = (xy)(xy)$$

$$c^5 = ccccc$$

$$y^3 = yyy$$

$$x^2 = xx$$

$$(x+5)^2 = (x+5)(x+5)$$

$$(x-3)^4 = (x-3)(x-3)(x-3)(x-3)$$

$$(a+b)^3 = (a+b)(a+b)(a+b)$$

Use exponents to shorten each expression .

$$aabb^3 = a^2b^3$$

$$5xyyyy = 5xy^4$$

$$6xyyxyxy = 6x^3y^4$$

$$xxxxyy = x^4y^2$$

$$10aaabbbb = 10a^3b^4$$

$$4abaaba = 4a^4b^2$$

$$mmmnn = m^3n^2$$

$$-3aabb = -3a^2b^2$$

$$xyxzxzxz = x^4yz^2$$

$$stttt = st^5$$

$$6xxyyzz = 6x^2y^2z^2$$

$$uvuvuv = u^3v^3$$

$$uuvv = u^2v^2$$

$$12mnnn = 12mn^3$$

$$-8rstsr = -8r^2s^2t$$

Write out each expression the long way.

$$6x^5y^2 = 6xxxxxyy$$

$$(ab)^3 = (ab)(ab)(ab)$$

$$8a^3b^2 = 8aaabb$$

$$(xy)^4 = (xy)(xy)(xy)(xy)$$

$$x^2y^5 = xxyyyyy$$

$$x^4y^4 = xxxxyyyy$$

$$12x^4y = 12xxxxy$$

$$(2x)^3(5y)^2 = (2x)(2x)(2x)(5y)(5y)$$

$$x^3y^2z^3 = xxxyyzzz$$

$$2x^4 = 2xxxx$$

$$a^3b^2c = aaabbc$$

$$(2x)^4 = (2x)(2x)(2x)(2x)$$

Here are the answers to the last two problems:

$$2x^4 = 2xxxx$$

$$(2x)^4 = (2x)(2x)(2x)(2x)$$

Did you get them right? Do you see why the answers have to be different? If you pay attention to parentheses you shouldn't have any trouble writing these out the long way:

$$5a^4 = 5aaaa$$

$$(7x)^2 = (7x)(7x)$$

$$(5a)^4 = (5a)(5a)(5a)(5a)$$

$$7x^2 = 7xx$$

$$6ab^3 = 6abbb$$

$$(xyz)^2 = (xyz)(xyz)$$

$$6(ab)^3 = 6(ab)(ab)(ab)$$

$$x(yz)^2 = x(yz)(yz)$$

$$(6ab)^3 = (6ab)(6ab)(6ab)$$

$$xyz^2 = xyzz$$

x	x^2
1	$1^2 = 1 \cdot 1 = 1$
2	$2^2 = 2 \cdot 2 = 4$
3	$3^2 = 3 \cdot 3 = 9$
4	$4^2 = 4 \cdot 4 = 16$
5	$5^2 = 5 \cdot 5 = 25$
6	$6^2 = 6 \cdot 6 = 36$
7	$7^2 = 7 \cdot 7 = 49$
8	$8^2 = 8 \cdot 8 = 64$
9	$9^2 = 9 \cdot 9 = 81$
10	$10^2 = 10 \cdot 10 = 100$
11	$11^2 = 11 \cdot 11 = 121$

x	x^2
-1	$(-1)^2 = (-1)(-1) = 1$
-2	$(-2)^2 = (-2)(-2) = 4$
-3	$(-3)^2 = (-3)(-3) = 9$
-4	$(-4)^2 = (-4)(-4) = 16$
-5	$(-5)^2 = (-5)(-5) = 25$
-6	$(-6)^2 = (-6)(-6) = 36$
-7	$(-7)^2 = (-7)(-7) = 49$
-8	$(-8)^2 = (-8)(-8) = 64$
-9	$(-9)^2 = (-9)(-9) = 81$
-10	$(-10)^2 = (-10)(-10) = 100$
-11	$(-11)^2 = (-11)(-11) = 121$

x	x^3
1	$1^3 = 1 \cdot 1 \cdot 1 = 1$
2	$2^3 = 2 \cdot 2 \cdot 2 = 8$
3	$3^3 = 3 \cdot 3 \cdot 3 = 27$
4	$4^3 = 4 \cdot 4 \cdot 4 = 64$
5	$5^3 = 5 \cdot 5 \cdot 5 = 125$
6	$6^3 = 6 \cdot 6 \cdot 6 = 216$

x	x^3
-1	$(-1)^3 = (-1)(-1)(-1) = -1$
-2	$(-2)^3 = (-2)(-2)(-2) = -8$
-3	$(-3)^3 = (-3)(-3)(-3) = -27$
-4	$(-4)^3 = (-4)(-4)(-4) = -64$
-5	$(-5)^3 = (-5)(-5)(-5) = -125$
-6	$(-6)^3 = (-6)(-6)(-6) = -216$

Equivalent Expressions

Here are two expressions:

$$(3x)(2x)$$

$$6x^2$$

Let's see what happens when we substitute several numbers for x .

x	$(3x)(2x)$
4	$(3 \cdot 4)(2 \cdot 4) = 12 \cdot 8 = 96$
10	$(3 \cdot 10)(2 \cdot 10) = 30 \cdot 20 = 600$
-2	$(3 \cdot 2)(2 \cdot 2) = 6 \cdot 4 = 24$
5	$(3 \cdot 5)(2 \cdot 5) = 15 \cdot 10 = 150$
3	$(3 \cdot 3)(2 \cdot 3) = 9 \cdot 6 = 54$

x	$6x^2$
4	$6(4)^2 = 6 \cdot 16 = 96$
10	$6(10)^2 = 6 \cdot 100 = 600$
-2	$6(-2)^2 = 6 \cdot 4 = 24$
5	$6(5)^2 = 6 \cdot 25 = 150$
3	$6(3)^2 = 6 \cdot 9 = 54$

You can try substituting some more numbers, but you will find that no matter what number you try, the answers in the two tables always come out the same. We say that $(3x)(2x)$ and $6x^2$ are **equivalent expressions**. This shouldn't surprise you since you already know that multiplication of integers is associative and commutative, so

$$(3x)(2x) = (3 \cdot 2)(xx) = 6x^2$$

Many times in algebra you will be asked to **simplify** an expression. All this means is that you are supposed to find an equivalent expression that's easier to write.

Simplify each expression below.

$$(4x)(5x) = (4 \cdot 5)(xx) = 20x^2$$

$$(3a)(6a) = (3 \cdot 6)(aa) = 18a^2$$

$$(5y)(5y) = (5 \cdot 5)(yy) = 25y^2$$

$$(2x)(7x) = (2 \cdot 7)(xx) = 14x^2$$

A term is a very simple kind of expression where multiplication is the only operation. Here are some examples of terms:

$$5x \quad 3a^2 \quad 8xy \quad x \quad 24a^4bc^3 \quad 7$$

Most terms have two parts — a number part and a variable part. For example, 5 is the number part of $5x$, and x is the variable part of $5x$. The number part is sometimes called the **coefficient**.

When we are multiplying terms, it is easiest to break the problem down into steps. First multiply the number parts of all the terms together. Then multiply the variable parts together.

$$(4x)(-5x) = (4 \cdot -5)(xx) = -20x^2$$

$$(4x)(-5x) = -20x^2$$

$$(7a)(2a) = 14a^2$$

$$(-3x)(5x) = -15x^2$$

$$(4y)(-3y) = -12y^2$$

$$(-6c)(-4c) = 24c^2$$

$$(2x)(4y) = (2 \cdot 4)(xy) = 8xy$$

$$(2x)(4y) = 8xy$$

$$(5a)(2b) = 10ab$$

$$(-4x)(-2y) = 8xy$$

$$(-10a)(4b) = -40ab$$

$$(7u)(-3v) = -21uv$$

$$(-7u)(-3v) = 21uv$$

$$(6c)(4c) = 24c^2$$

$$(10a)(-2a) = -20a^2$$

$$(6x)(5x) = 30x^2$$

$$(-7w)(3w)(2w) = -7 \cdot 3 \cdot 2w^3 = -42w^3$$

$$(2a)(-5a)(-5a) = 2 \cdot -5 \cdot -5a^3 = 50a^3$$

$$(x)(7x)(2x) = 14x^3$$

$$(-1v)(4v)(2v) = -8v^3$$

$$(6u)(-8v) = -48uv$$

$$(6u)(8v) = 48uv$$

$$(5x)(2y)(3z) = 30xyz$$

$$(-6a)(b)(7c) = -42abc$$

$$(-3u)(-3v)(-3w) = -27uvw$$

$$(2a)(5b)(2c)(3d) = 60abcd$$

$$(5t)(-10u)(-3v) = 150tuv$$

simplify.

When you multiply with variables, you add the exponents.

$$(5x^2)(3x^3) = (5xx)(3xxx) = (5 \cdot 3)(xxxxx) = 15x^5$$

$$5x^2)(3x^3) = 15x^5$$

$$(3x)(5x^3)(4x^2) = 60x^6$$

$$(6x^3)(2x^4) = 12x^7$$

$$(-4n)(-2n^2)(n) = 8n^4$$

$$5a^2)(-5a^4) = -25a^6$$

$$(6a^4)(6a^4) = 36a^8$$

$$-9x)(-4x^3) = 36x^4$$

$$(-2a^2)(-2a^2)(-2a^2) = -8a^6$$

$$(-9x^2y)(8x^2y^4) = (-9xxxy)(8xyyy) = -72x^4y^5$$

$$(-9x^2y)(8x^2y^4) = -72x^4y^5$$

$$(2x)(5y)(-6x) = -60x^2y$$

$$(4a^2b^3)(7a^2b) = 28a^4b^4$$

$$(x^2y)(xy)(x) = x^4y^2$$

$$(-3x^2y^3)(-9x^3y^5) = 27x^5y^8$$

$$(-4x)(-8y)(-2x^2) = -64x^3y$$

$$(9x^2)(6y^2) = 54x^2y^2$$

$$(5x^2y)(6x^5y^2) = 30x^7y^3$$

$$(3x^4y)(7x^3y) = 21x^7y^2$$

$$(-10x^2y^3)(x^4y^2)(9y) = -90x^6y^6$$

$$(-5xy)(-9xy)(-2xy) = -90x^3y^3$$

$$(4x)(-3y)(2x)(2y) = -48x^2y^2$$

$$(5mn)(-9m^3n) = -45m^4n^2$$

$$(-6x^5y^3z)(x^4z) = -6x^9y^3z^2$$

$$(-4x)(-4x)(-4x) = -64x^3$$

$$(x^2y)(x^2y)(x^2y)(x^2y) = x^8y^4$$

$$(3xy)(3xy)(3xy) = 27x^3y^3$$

$$(2xy)(2xy)(2xy)(2xy) = 16x^4y^4$$

$$(2x^3)(2x^3)(2x^3)(2x^3) = 16x^{12}$$

$$(4x^4)(4x^4)(4x^4) = 64x^{12}$$

$$(3x^2)(3x^2)(3x^2)(3x^2) = 81x^8$$

$$(5x^5)(5x^5)(5x^5) = 125x^{15}$$

$$(2x)(2x)(2x)(2x)(2x)(2x)(2x)(2x)(2x) = 2^9x^9 = 512x^9$$

$$(2a)(2b)(2c)(2d)(2e)(2f)(2g)(2h)(2i) = 512abcdefghi$$

Then multiply the terms together. Power raised to a power, multiply.

$$(4x)^2 = (4x)(4x) = 16x^2$$

$$(3x)^2 = 3^2 x^2 = 9x^2$$

$$(6x)^2 = 6^2 x^2 = 36x^2$$

$$(7a)^2 = 7^2 a^2 = 49a^2$$

$$(5w)^2 = 5^2 w^2 = 25w^2$$

$$(10z)^2 = 10^2 z^2 = 100z^2$$

$$(3x^2y^3)^2 = (3x^2y^3)(3x^2y^3) = 9x^4y^6$$

$$(8a^3b)^2 = 8^2 a^{3 \cdot 2} b^2 = 64a^6b^2$$

$$(10ab^4)^2 = 10^2 a^2 b^{4 \cdot 2} = 100a^2b^8$$

$$(6xyz)^2 = 6^2 x^2 y^2 z^2 = 36x^2y^2z^2$$

$$(a^3b^4)^2 = a^{3 \cdot 2} b^{4 \cdot 2} = a^6b^8$$

$$(-9y^3)^2 = (-9)^2 y^{3 \cdot 2} = 81y^6$$

$$(-4x^2)^3 = (-4x^2)(-4x^2)(-4x^2) = -64x^6$$

$$(3x^2)^3 = 3^3 x^{2 \cdot 3} = 27x^6$$

$$(5a^3)^3 = 5^3 a^{3 \cdot 3} = 125a^9$$

$$(-2xy)^3 = (-2)^3 x^3 y^3 = -8x^3y^3$$

$$(a^2b^5)^3 = a^{2 \cdot 3} b^{5 \cdot 3} = a^6b^{15}$$

$$(2x^3)^3 = 2^3 x^{3 \cdot 3} = 8x^9$$

$$(2x^3)^4 = 2^4 x^{3 \cdot 4} = 16x^{12}$$

$$(2x^3)^5 = 2^5 x^{3 \cdot 5} = 32x^{15}$$

$$(2x^3)^6 = 2^6 x^{3 \cdot 6} = 64x^{18}$$

$$(2x^2)^3(5x)^2 = (2x^2)(2x^2)(2x^2)(5x)(5x) = 200x^8$$

$$(3x)^4(x^2y)^3 = (3^4x^4)(x^{2 \cdot 3}y^3) = 81x^{4+6}y^3 = 81x^{10}y^3$$

$$(3x^4)^2(2x)^3 = 3^2 \cdot 2^3 x^{4 \cdot 2} x^3 = 9 \cdot 8 x^{8+3} = 72x^{11}$$

$$(a^2b)^3(ab^3)^2 = a^{2 \cdot 3} b^3 a^2 b^{3 \cdot 2} = a^6 b^3 a^2 b^6 = a^{6+2} b^{3+6} = a^8 b^9$$

Finding Powers with a Calculator

With a calculator we can compute a power of a number very easily. To compute 3^5 we could press these keys:

The calculator shows:

$3 \times 3 \times 3 \times 3 \times 3 = 243$

On many calculators we can do this even more quickly. Here's how:

When we enter $3 \times =$ the calculator shows 9 which is 3^2

then press $\times 3 =$ the calculator shows 27 which is 3^3

and again press $\times 3 =$ the calculator shows 81 which is 3^4

and once more press $\times 3 =$ the calculator shows 243 which is 3^5

Notice that we press the $=$ key *one less* time than the exponent.

Here's how we would find 2^6 :

$2 \times = = = = = 64$

Do each problem using a calculator.

$\wedge = \text{"carat"}$

~~$5 \times = =$~~

$5^3 = 5 \wedge 3 = 125$

$8^4 = 8 \wedge 4 = 4096$

$2^{10} = 2 \wedge 10 = 1024$

$7^7 = 7 \wedge 7 = 823,543$

$8^8 = 8 \wedge 8 = 16,777,216$

~~$5 \times = = =$~~

$5^4 = 5 \wedge 4 = 625$

$3^6 = 3 \wedge 6 = 729$

$1^{16} = 1 \wedge 16 = 1$

$10^5 = 10 \wedge 5 = 100,000$

$5^{10} = 5 \wedge 10 = 9,765,625$

To measure length we use units like inches or centimeters. To measure area we need a unit which will cover a surface, so we have to use square units.

_____ 1 inch

_____ 1 centimeter

_____ 1 unit

1 square inch

1 square centimeter

1 square unit

(Units can be any size.)

Find the area of each figure by counting the number of square units inside.

A = 20 sq. units

A = 7 sq. units

3×6
A = 18 sq. units

4×4
A = 16 sq. units

When the figure is a rectangle we can save time by just multiplying the length by the width to find the number of square units. That's what the **formula** below means.

$$A = lw$$

Use this formula to find the area of each rectangle below.

Rectangle	l	w	A = lw
A	5	3	A = 5 · 3 = 15
B	8	2	A = 8 · 2 = 16
C	4	8	A = 4 · 8 = 32
D	9	9	A = 9 · 9 = 81
E	90	20	A = 90 · 20 = 1800
F	11	32	A = 11 · 32 = 352

Do you see what these three rectangles have in common? The length is double the width.

The length of each rectangle is two times its width. We can show a pattern for rectangles of this type by using a variable. If we use x to show the width, then the length is $2x$.

Then we can use the formula $A = lw$ to find an expression for the area.

$$A = lw = (2x)(x) = 2x^2$$

Write an expression for the area of each rectangle below.

Rectangle	l	w	$A = lw$
A	$5xy$	$3x$	$A = (5xy)(3x) = 15x^2y$
B	$4a$	$4a$	$A = (4a)(4a) = 16a^2$
C	x	$7x$	$A = (x)(7x) = 7x^2$
D	$4b$	$2a$	$A = (4b)(2a) = 8ab$
E	$5x^2$	x^2	$A = (5x^2)(x^2) = 5x^4$

Terms that have equivalent variable parts are called like terms. Terms with variable parts that are not equivalent are called unlike terms.

$2x$, $3x$ and $-5x$ are like terms.

$-6a^3$, a^3 , $5aaa$ and $32a^3$ are like terms.

8, 1, -63 and -4 are like terms.

$7x^3y^2$, x^3y^2 , $4xxxxyy$ and $-6y^2x^3$ are like terms.

Look at each pair of terms and decide if they are like terms or unlike terms.

Circle the right answer.

$3x^2$ and $4xx$ <input checked="" type="radio"/> like <input type="radio"/> unlike	$2a^3$ and $5a^3$ <input checked="" type="radio"/> like <input type="radio"/> unlike	$4x$ and $7y$ <input type="radio"/> like <input checked="" type="radio"/> unlike
$6x^4$ and $2x^3$ <input type="radio"/> like <input checked="" type="radio"/> unlike	$3xy$ and $2yx$ <input checked="" type="radio"/> like <input type="radio"/> unlike	$7c$ and 7 <input type="radio"/> like <input checked="" type="radio"/> unlike
5 and -13 <input checked="" type="radio"/> like <input type="radio"/> unlike	$7x^2y$ and $3yxx$ <input checked="" type="radio"/> like <input type="radio"/> unlike	$4x$ and $-4x$ <input checked="" type="radio"/> like <input type="radio"/> unlike

Match like terms.

Combining Like Terms

Look at these two expressions:

$$5x + 3x$$

$$8x$$

Do up to 31

When we substitute different numbers for x , here's what we get:

x	$5x + 3x$	x	$8x$
3	$5(3) + 3(3) = 15 + 9 = 24$	3	$8(3) = 24$
10	$5(10) + 3(10) = 50 + 30 = 80$	10	$8(10) = 80$
-2	$5(-2) + 3(-2) = -10 + -6 = -16$	-2	$8(-2) = -16$
5	$5(5) + 3(5) = 25 + 15 = 40$	5	$8(5) = 40$

As you can see, we get the same answers each time. This happens because $5x + 3x$ and $8x$ are equivalent expressions. We can show that they are equivalent by using the Distributive Principle:

$$5x + 3x = (5 + 3)x = 8x$$

We can always use the Distributive Principle when we are adding like terms. Just add the number parts of the terms; the variable part stays the same. Here is another example:

$$2a^2 + 4a^2 = (2 + 4)a^2 = 6a^2$$

Of course, it's much easier to just write:

$$2a^2 + 4a^2 = 6a^2$$

Here are some expressions for you to simplify:

$$\underline{10}xy + \underline{7}xy = 17xy$$

$$\underline{5}x^2 + \underline{-7}x^2 = -2x^2$$

$$\underline{9}x^4 + \underline{-5}x^4 = 4x^4$$

$$\underline{6}a^3 + \underline{4}a^3 = 10a^3$$

$$\underline{-5}s + \underline{-3}s = -8s$$

$$\underline{4}x^2y + \underline{3}x^2y = 7x^2y$$

... simply by adding like terms. (Remember, to add like terms you just have to add the number parts. The variable part stays the same.)

$$3x^2 + 9x^2 = 12x^2$$

$$9w + 5w = 14w$$

$$10a + 4a = 14a$$

$$-5yz + 5yz = 0yz = 0$$

$$2y^3 + 8y^3 = 10y^3$$

$$3 + -5 = -2$$

$$13xy + 13xy = 26xy$$

$$2x^2 + 2x^2 = 4x^2$$

$$8a^4 + -2a^4 = 6a^4$$

$$5a + 1a = 6a$$

$$-7x + -4x = -11x$$

$$13m^3 + 1m^3 = 14m^3$$

You already know that if x is any integer, then $1 \cdot x = x$. So when you see x in a problem you can change it to $1x$. You can also change a to $1a$, a^2 to $1a^2$, xy to $1xy$, etc.

$$4x + x = 4x + 1x = 5x$$

$$4x + 1x = 5x$$

$$10a^2 + a^2 = 11a^2$$

$$8a + 1a = 9a$$

$$x + 3x = 4x$$

$$2xy + xy = 3xy$$

$$x^2 + 8x^2 = 9x^2$$

$$x + 6x = 7x$$

$$c + c = 2c$$

$$-3y + y = -2y$$

$$-5x + x = -4x$$

$$5x + 3x + 4x = 12x$$

$$6x^2 + -2x^2 + 5x^2 = 9x^2$$

$$10ab + -5ab + -3ab = 2ab$$

$$5x + (x + 4x) = 10x$$

$$-8n + (3n + 8n) = 3n$$

$$y^2 + y^2 + y^2 = 3y^2$$

$$5x + \overbrace{(-8x + -7x)}^{-15x} + 8x + 2x + 7x + -5x = 2x$$

$$6x^2yz^3 + 3x^2yz^3 + 5x^2yz^3 + -9x^2yz^3 = 5x^2yz^3$$

Be careful on these problems! Just add like terms.

$$\underline{4x} + 8y + \underline{3x} = 7x + 8y$$

↑ like terms ↑

$$\underline{5y} + \underline{8y} + 4z = 13y + 4z$$

↑ like ↑

$$\underline{3} + 9b + \underline{10} = 9b + 13$$

$$\underline{8x^2} + \underline{2x^2} + 7x = 10x^2 + 7x$$

$$\underline{6xy} + \underline{3xy} + 3x = 9xy + 3x$$

$$\underline{-3ab} + \underline{-10a} + \underline{-8a} = -3ab - 18a$$

$$\underline{6a} + 7b + \underline{5a} + 7b = 11a + 14b$$

$$\underline{3x} + 6y + \underline{2y} + 8x = 11x + 8y$$

$$\underline{9x^2} + 10 + \underline{4x^2} + 7 = 13x^2 + 17$$

$$\underline{4x} + \underline{x} + \underline{3x} + 8y = 8x + 8y$$

$$\underline{7x^2y} + 8 + \underline{-5x^2y} + 4 = 2x^2y + 12$$

$$\underline{5a} + 3b + \underline{4c} + 2a = 7a + 3b + 4c$$

$$\underline{6x^3} + \underline{9x} + \underline{10x^3} + 4x^2 = 16x^3 + 4x^2 + 9x$$

$$\underline{8a^2} + 4ab + \underline{6a} + \underline{-8a^2} = 6a + 4ab$$

$$\underline{7a} + 5b + \underline{c} + \underline{4a} + \underline{-3b} = 11a + 2b + c$$

$$(6xy + \underline{-8xy}) + (5xy + \underline{-2xy}) = xy$$

$$\underline{10x^4} + \underline{-8x^3} + \underline{4x^3} + \underline{5x^2} + \underline{3x} = 10x^4 - 4x^3 - 5x^2 + 3x$$

$$\underline{4xy} + \underline{-4xz} + \underline{7xy} + \underline{-11xy} = -4xz$$

$$\underline{8x} + \underline{6} + \underline{7x} + \underline{-10} + \underline{-5x} + \underline{8} = 10x + 14$$

$$7a + \underline{5c} + \underline{4c} = 7a + 9c$$

$$\underline{4x^2} + 9 + \underline{4x^2} = 8x^2 + 9$$

$$\underline{x} + 3y + \underline{3x} = 4x + 3y$$

$$\underline{10x^4} + \underline{8x^4} + 6x^3 = 18x^4 + 6x^3$$

$$\underline{1xy} + x + \underline{1xy} = 2xy + x$$

$$\underline{1a} + \underline{1a} + 5 = 2a + 5$$

$$\underline{-4x^2y} + \underline{-6} + \underline{-6x^2y} = -10x^2y - 6$$

Here are some expressions with subtraction. Every time you see a subtraction sign, you should add the opposite of the next term. Do all the figuring in your head. Just write down the answer.

$$3x + -7x = -4x$$

$$3x - 7x = -4x$$

$$12a + -2a = 10a$$

$$12a - 2a = 10a$$

$$5 + -8 =$$

$$5 - 8 = -3$$

$$2xy + -7xy = -5xy$$

$$10x^2 + -6x^2 = 4x^2$$

$$6abc + -5abc = abc$$

$$5x + 3x + -11x =$$

$$5x + 3x - 11x = -3x$$

$$3a^2 + -6a^2 + 10a^2 = 7a^2$$

$$10 + 5 + -8 = 7$$

$$7xy + -5xy + -5xy = -3xy$$

$$4m + m + -2m = 3m$$

$$6x^2y + -2x^2y + -10x^2y + 8x^2y = 2x^2y$$

$$9p + -3p + -9p + 3p = 0$$

$$a + 3a + a + -2a + 4a + -2a = 5a$$

$$9y + -13y = -4y$$

$$3m + -10m = -7m$$

$$7ab + -7ab = 0$$

$$14a + -9a = 5a$$

$$3 + -8 = -5$$

$$x + -8x = -7x$$

$$4xy + -xy = 3xy$$

$$x^2 + -x^2 = 0$$

simplify.

$$9x - 5x + x - 3x = 2x$$

$$9x - 5x + x - 3x = 2x$$

$$5a + 2a - 4a + a = 4a$$

$$5xy - 2xy - 4xy - 3xy = -4xy$$

$$4x^2 - 9x^2 + x^2 + 2x^2 - 8x^2 = -12x^2$$

$$10 + 3 + 2 + 4 = 1$$

$$8y + 2y + y + 4y + 5y + 10y = 6y$$

$$5(ab)^2 + 6(ab)^2 - 4(ab)^2 + 3(ab)^2 = 10(ab)^2$$

$$5x - 8x + 3x - 7x + 6x - 4x = -5x$$

$$8x^4 + x^4 - 6x^4 - 4x^4 - 5x^4 = -6x^4$$

$$5ab - 3ab + (9ab - 6ab) + 7ab = 12ab$$

$$7c - 10c + 8c - c - c = 3c$$

$$4rt + (rt + rt) - 3rt + 5rt = 8rt$$

$$6z - 4z - z + 10z + 3z = 14z$$

$$x + x + x - x - x + x = 2x$$

$$5a^2bc^3 - 7a^2bc^3 + a^2bc^3 + 2a^2bc^3 = a^2bc^3$$

$$6 + 5 - 8 + 3 - 10 + 4 - 5 = -5$$

$$4m - 7m + 13m - 4m + 7m - 13m = 0$$

$$5y + y - 6y - y - y - y = -3y$$

$$3a + 5b - 7b = 3a - 2b$$

$$3a + 5b - 7b = 3a - 2b$$

$$8s - 3s + 4k = 5s + 4k$$

$$10x + 6y - 5x = 5x + 6y$$

$$10x - 6y + 5x = 15x - 6y$$

$$16a + 9 - 7a = 9a + 9$$

$$a + 2b - 8a = -7a + 2b$$

$$2x - 6y + 7x + 2y = 9x - 4y$$

$$6s^2 - 3s^2 + 4t - 6s^2 = -3s^2 + 4t$$

$$2b + 4 + 3b + 9 = 5b + 13$$

$$10 - 14xy + 12xy + 21 = -2xy + 31$$

$$3x - 7y + 5x - y =$$

$$6c - 5 - 2c - 7(-8d) = 4c - 8d - 12$$

$$2x + 5y + 3 + 7x + 2y + 7 = 9x + 7y + 10$$

$$12 + 6p + 3q - 5p + 7q - 2 = p + 10q + 10$$

$$a^2 + 5a - 3 - 7a + 6a^2 - 4 = 7a^2 - 2a - 7$$

$$6x^2y + 3xy^2 - 4x^2y - 3xy^2 + x^2y = 3x^2y$$

$$5 + x - 3 + 2x - x + 7 - 8 + x = 3x + 1$$

$$x^2 - 7x + 4 + x^2 + 4x + 6 = 2x^2 - 3x + 10$$

$$3x^2 + 5 + x^2 - 9 + x^2 + 16 = 5x^2 + 12$$

$$5a - 4b + 2c - 3b - 6c + a = 6a - 7b - 4c$$

Perimeters

The perimeter of a figure is the distance all the way around the outside of the figure. Write an expression for the perimeter of each figure below.

Figure	Perimeter
A	$P = 3x + x + 2 + 3x + x + 2 = 8x + 4$
B	$P = x + 6 + x + 6 + x + 1 = 3x + 13$
C	$P = 5a + 5a + 5a + 5a = 20a$
D	$P = 3x + 2x + 2x + 3x + x + 2x = 13x$
E	$P = 4x + 8 + 6x + 6x = 16x + 8$
F	$P = 3a - 2b + 8a + 3a - 2b + 8a = 22a - 4b$
G	$P = l + w + l + w = 2l + 2w$
H	$P = s + s + s + s = 4s$
I	$P = a + b + c + d$
J	$P = x^2 + 5x + 4 + x^2 + 2x^2 - 3x + 6 = 4x^2 + 2x + 10$

Then write an expression for each other side and an expression for the perimeter.
Simplify the expression for the perimeter if you can.

A triangle with two sides each 5 cm longer than the third side.

$$P = x + x + 5 + x + 5 = 3x + 10$$

A rectangular dog pen which is 5 times as long as it is wide.

The same dog pen after it is enlarged by adding 3 feet to the length.

A helicopter pad which is a square.

A rectangular rug with a width that is 7 feet shorter than its length.

Another rug which is twice as long as it is wide.

Order of Operations

Up to now the simplifying problems you have done were only one step long. You just had to look at the problem, think, and write down the answer.

In this section are some simplifying problems that take more than one step — so you will have to figure out what to do first. You can tell by using the following rule:

1. If there are *parentheses*, first do what is in them.
2. Then do all the *multiplying*, from left to right.
3. Finally, do the rest of the *adding and subtracting*, from left to right.

Simplify.

$5(4a + 2a)$ $5(6a)$ $30a$	$10y \cdot 2y - 5y \cdot 3y$ $20y^2 - 15y^2$ $5y^2$	$10x - (9x - 2x)$ $10x - 7x$ $3x$
$7(9x - 3x)$ $7(6x)$ $42x$	$5(3x^2) - (2x)(4x)$ $15x^2 - 8x^2$ $7x^2$	$14n + (3n - 5n)$ $14n + -2n$ $12n$

Using the Distributive Principle

The terms x and 3 are not like terms, so we cannot simplify $5(x + 3)$ by adding the terms in the parentheses. Instead, we use the Distributive Principle.

$$5(\overbrace{x+3}) = 5x + 5 \cdot 3 = 5x + 15$$

$$5(x - 3) = 5x - 5 \cdot 3 = 5x - 15$$

Write an equivalent expression using the Distributive Principle.

$$2(\overbrace{x+6}) = 2x + 12$$

$$2(x - 6) = 2x - 12$$

$$3(2x + 4) = 6x + 12$$

$$8(x + 2) = 8x + 16$$

$$8(x - 2) = 8x - 16$$

$$11(5x + 2) = 55x + 22$$

$$6(x + 4) = 6x + 24$$

$$6(x - 4) = 6x - 24$$

$$-2(3x + 1) = -6x - 2$$

$$(x + 3)4 = 4x + 12$$

$$(x - 3)4 = 4x - 12$$

$$6(2x - 3) = 12x - 18$$

$$(x + 9)7 = 7x + 63$$

$$(x - 9)7 = 7x - 63$$

$$5(5x - 2) = 25x - 10$$

$$-3(x + 1) = -3x - 3$$

$$(x + 1)(-3) = -3x - 3$$

$$(3x - 10)(-5) = -15x + 50$$

$$5(x^2 + 6) = 5x^2 + 30$$

$$(x^2 - 6)5 = 5x^2 - 30$$

$$(2x^2 + 1)(-3) = -6x^2 - 3$$

Simplify.

$$8 + 3(x + 2)$$

$$8 + 3x + 6$$

$$3x + 14$$

$$x + 4(\overbrace{x-6})$$

$$x + 4x - 24$$

$$5x - 24$$

$$5(2x - 3) + 14$$

$$10x - 15 + 14$$

$$10x - 1$$

$$-2(x + 7) + 12x$$

$$-2x - 14 + 12x$$

$$10x - 14$$

$$x + 3(x - 4) + 2x$$

$$x + 3x - 12 + 2x$$

$$6x - 12$$

$$5x^2 + 3(x^2 - 1)$$

$$5x^2 + 3x^2 - 3$$

$$8x^2 - 3$$

$$10a + 2(a + 9) + 25$$

$$10a + 2a + 18 + 25$$

$$12a + 33$$

$$5y + (x - 4)(-7)$$

$$5y - 7x + 28$$

$$x + 2(x + 1) + x^2$$

$$x + 2x + 2 + x^2$$

$$x^2 + 3x + 2$$

Find the number you get for each expression when you substitute 4 for x .

$x + 5$ $4 + 5$ 9	$x + 3$ $4 + 3$ 7	$x + 10$ $4 + 10$ 14	$x - 2$ $4 - 2$ 2	$x - 6$ $4 - 6$ -2	$x - 4$ $4 - 4$ 0
$3x$ $3(4)$ 12	$5x$ $5(4)$ 20	$9x$ $9(4)$ 36	$-3x$ $-3(4)$ -12	$-5x$ $-5(4)$ -20	$1x$ $1(4)$ 4
$3x + 5$ $3(4) + 5$ $12 + 5$ 17	$2x + 3$ $2(4) + 3$ $8 + 3$ 11	$8x + 4$ $8(4) + 4$ $32 + 4$ 36	$3x - 2$ $3(4) - 2$ $12 - 2$ 10	$5x - 10$ $5(4) - 10$ $20 - 10$ 10	$2x - 10$ $2(4) - 10$ $8 - 10$ -2
$4(x + 2)$ $4(4 + 2)$ $4(6)$ 24	$5(x + 3)$ $5(4 + 3)$ $5(7)$ 35	$3(x + 1)$ $3(4 + 1)$ $3(5)$ 15	$7(x - 1)$ $7(4 - 1)$ $7(3)$ 21	$5(x - 2)$ $5(4 - 2)$ $5(2)$ 10	$3(x - 7)$ $3(4 - 7)$ $3(-3)$ -9

$-x + 2$ $-(4) + 2$ -2	$-x + 3$ $-(4) + 3$ -1	$-x + 4$ $-(4) + 4$ 0	$-x + 5$ $-(4) + 5$ 1	$-x - 5$ $-(4) - 5$ -9	$-x - 4$ $-(4) - 4$ -8

Find the value of each expression when $a=5$, $b=3$ and $c=2$.

$a + b$ $5 + 3$ 8	$a + c$ $5 + 2$ 7	$b + c$ $3 + 2$ 5	$a - b$ $5 - 3$ 2	$b - a$ $3 - 5$ -2	$a - c$ $5 - 2$ 3
ab $5 \cdot 3$ 15	ac $(5)(2)$ 10	bc $3 \cdot 2$ 6	a^2 5^2 25	b^2 3^2 9	c^2 2^2 4
$a + b + c$ $5 + 3 + 2$ 10	$a - b - c$ $5 - 3 - 2$ 0	$a - (b - c)$ $5 - (3 - 2)$ 4	$a - (b + c)$ $5 - (3 + 2)$ 0		
$a(b + c)$ $5(3 + 2)$ $5(5)$ 25	$ab + ac$ $5 \cdot 3 + 5 \cdot 2$ $15 + 10$ 25	$b(a + c)$ $3(5 + 2)$ $3(7)$ 21	$ba + bc$ $3 \cdot 5 + 3 \cdot 2$ $15 + 6$ 21		
abc $5 \cdot 3 \cdot 2$ 30	$a^2 + b^2$ $5^2 + 3^2$ $25 + 9$ 34	$a^2 - c^2$ $5^2 - 2^2$ $25 - 4$ 21	$a^2 c^2$ $5^2 \cdot 2^2$ $25 \cdot 4$ 100		
$(a + b)(a + b)$ $(5 + 3)(5 + 3)$ $(8)(8)$ 64	$a^2 + 2ab + b^2$ $5^2 + 2(5)(3) + 3^2$ $25 + 30 + 9$ 64	$(a + b)(a - b)$ $(5 + 3)(5 - 3)$ $(8)(2)$ 16	$a^2 - b^2$ $5^2 - 3^2$ $25 - 9$ 16		

Practice Test

Finish each substitution table.

x	$4x$
5	$4(5) = 20$
6	$4(6) = 24$
-5	$4(-5) = -20$
-6	$4(-6) = -24$
0	$4(0) = 0$

x	$x + 6$
5	$5 + 6 = 11$
6	$6 + 6 = 12$
-5	$-5 + 6 = 1$
-6	$-6 + 6 = 0$
0	$0 + 6 = 6$

x	$-x$
5	$-(5) = -6$
6	$-(6) = -6$
-5	$-(-5) = 5$
-6	$-(-6) = 6$
0	$-(0) = 0$

Use exponents to simplify each expression.

$$xxxxxx = x^6$$

$$3aaaa = 3a^4$$

$$-6xxyyy = -6x^2y^3$$

$$2xxxx = 2x^4$$

$$(3y)(3y) = (3y)^2$$

$$(mn)(mn)(mn) = (mn)^3$$

$$6(ab)(ab) = 6(ab)^2$$

$$(2x)(2x)(2x)(2x) = (2x)^4$$

Compute.

$$5^2 = 25$$

$$(-3)^2 = 9$$

$$8^2 = 64$$

$$2^5 = 32$$

$$3^3 = 27$$

$$(-10)^3 = -1,000$$

Simplify.

$$(8x^3)(2x^2) = 16x^5$$

$$(-5a)(3b) = -15ab$$

$$(-6xy)(-6xy) = 36x^2y^2$$

$$(x^2yz^3)(xy^4) = x^3y^5z^3$$

$$(-3xy)(-2x^2)(-4x^2y) = -24x^5y^2$$

$$(3x)(3x)(3x)(3x) = 81x^4$$

$$(2a)(3b)(5c) = 30abc$$

$$(xy^2)(xyz)(xyz^3) = x^3y^4z^4$$

Simplify.

$$5a + 4b - 3a = 2a + 4b$$

$$6x^2 - 8x^2 - 5x = -2x^2 - 5x$$

$$x + 7x + 5 = 8x + 5$$

$$6ab - 8ab + 4ab = 2ab$$

$$7x - 8y - 3x + 10y = 4x + 2y$$

$$x^2 + 3x + 4 + x^2 + 2x - 6 = 2x^2 + 5x - 2$$

$$a + 7 - 4 + 3a + a - 2a = 3a + 3$$

$$6a + 4b - 3c - 6b = 6a - 2b - 3c$$

$$* 4x^3 - 2x(10x^2 - 3x^2) = 4x^3 - 20x^3 + 6x^3 = 10x^3$$

$$* (a + 4a) - 2(6a - 10a) = a + 4a - 12a + 20a = 13a$$

$$5x + 7 + 3(x - 7) = 5x + 7 + 3x - 21 = 8x - 14$$

Do each problem in two steps. First write it out the long way. Then multiply terms.

$$(8a)^2 = 8^2 a^2 = 64a^2$$

$$(3x)^3 = 3^3 x^3 = 27x^3$$

$$(2x^2)^4 = 2^4 x^8 = 16x^8$$

$$(x^2 y^3)^3 = x^6 y^9$$

Evaluate each expression for $a = 2$ and $b = -3$.

$10a + 2b$ $10(2) + 2(-3)$ $20 + -6$ 14	$a + b$ $2 + -3$ -1	$a - b$ $2 + (+3)$ 5
ab $2(-3)$ -6	$3a + 2b$ $3(2) + 2(-3)$ $6 + -6$ 0	$a^2 + b^2$ $2^2 + (-3)^2$ $4 + 9$ 13
